Community Events Explorer

Project overview

Fictional personal prototype by Alex Morgan. The application helps visitors find sample community events using category and date filters.

Personal contribution

Implemented React components, TypeScript models, filter controls and component tests. Used a small fictional local dataset rather than a live third-party events API.

Design decisions

Kept filtering deterministic and separated data access from presentation components. Added keyboard-accessible controls and explicit empty states.

Scope and limitations

This is a demonstration prototype. No production deployment, user-study results, performance benchmark, revenue, attendance improvement or external partnership is documented. It does not process payments or sell tickets.

Example stack

TypeScript, React, component testing, local JSON sample data
